Let's Start!

Let's check that data!

Learning Outcome:

Designs the data structure based on the database structures and its characteristics.

Validate database using the proper IT tools.

Can Do Statements:

- I can explain what validation means.
- I can talk about data validation importance.
- I can describe the different options to perform a data validation.

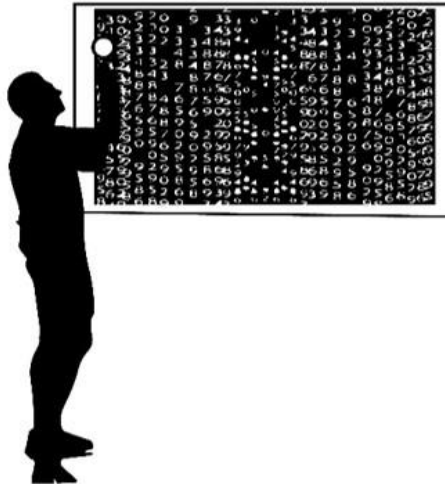

Ask your partner:

- What types of applications require the most accurate verification and work prior to their release? Why?
- What are the most common data errors you can find in applications? Why?

Let's Explore!

The end of the term...

Instructions: Read the text below.

- Teacher:** This is your oral test for the systems program. You will answer three different questions about this term's topics and you are going to have one minute to answer each one of them.
- Brienne:** I'd rather not look at the time. I'll just focus on answering.
- Teacher:** Can you define what validation is?
- Brienne:** Sure, in the systems field, we'll always have to carry out data validation processes. I would rather not see it as a validation but as an inspection of the data needed for the system to perform suitably. This process makes sure that the different inputs of the system work in accordance with their purpose; furthermore, we would rather not execute it when the application is finished, but throughout its development stage.
- Teacher:** Can you please describe the importance of this process?
- Brienne:** Sure, the data validation is going to aim to verify the completeness and correctness of all the data needed in the application, ensuring its correct operation once it is launched. Any person who performs this process would rather not focus on the application, but on the faulty data elements to fix them right away. Furthermore, it enables an early analysis of how the application is being developed, avoiding future data loss.
- Teacher:** That is right. Can you describe the different options available to perform a data validation process?
- Brienne:** I would rather not be so specific about that; however, we have four different options I'm applying once I graduate. The default validation, which identifies orphan pages and updates them; the full validation, which confirms, reports, and updates corrupted structures. The read-only validation only reports flaws, but does not fix them; finally, the ignore checksum error enables the validation of corrupted databases.

Let's Practice!

The data validation process.

Instructions: Classify the sentences by writing the number of the sentence in the correct category.

1. On Friday, Sam issues his essay on how data validation inspects the data needed for the system to perform suitably.
2. The data default validation option is going to identify orphan pages and it's going to update them.
3. The data validation also is going to ensure data correct operation once it is launched.
4. Next week, we give our talk on how data validation enables an early analysis of how the application is developed.
5. The data validation is going to aim to verify the completeness and correctness of all the data needed in the application.
6. Tomorrow night, we meet to talk about data validation. We'll discuss how it makes sure that the different inputs of the system work in accordance with their purpose.

Future with Going to	Future with Simple Present

Let's Practice!

Brienne would rather not miss this information.

Instructions: Match column A with column B. Read the sentences aloud. Check your pronunciation with your instructor.

COLUMN A

1. Data validation
2. Orphan pages
3. Faulty
4. Launch
5. Execute
6. Suitably

COLUMN B

- a. in a correct and appropriate way or manner.
- b. to start a software.
- c. to carry out something, to perform an action or activity.
- d. web pages where users can't go further, there are no outgoing links.
- e. is process in which you make sure that the system's input is correct, accurate and fully operational.
- f. something imperfect or with fails.

Extension Activity

Let's evaluate the system that the software company delivered.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about validation of new software in companies.
- Design a chart in which you describe items to evaluate, what, how, who evaluate each item
- Explain to your classmates and answer all the questions.

Self-Assessment

Yes

No

- I look for information about validation of new software in companies.
- I write descriptions about how to validate the software suitably.
- I talk about validation systems and how to apply them.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **suitably** (adverb): in a correct and appropriate way or manner
e.g. I would rather not see it as a validation but as an inspection of the data needed for the system to perform suitably.
- **in accordance with** (expression): obeying or following something
e.g. This process makes sure that the different inputs of the system work in accordance with their purpose.
- **execute** (verb): to carry out something, to perform an action or activity
e.g. Furthermore, we would rather not execute it when the application is finished, but throughout its development stage.
- **aim** (verb): to intend to achieve or accomplish something
e.g. Sure, the data validation is going to aim to verify the completeness and correctness of all the data needed in the application.
- **orphan page** (noun): a page that is intended to function, but that end up failing and being unused
e.g. The default validation, which identifies orphan pages and updates them.
- **corrupt** (adjective): information that is not usable as it changes and fails
e.g. Finally, the ignore checksum error enables the validation of corrupted databases.

Learning Points

Would Rather for What Is Preferable – Negative Form

You use the expression **would rather** to show preference.

The expression **would rather** in negative form can be used to show preference of one negative option over several. Remember that you can use the abbreviation of would, which is " 'd". The structure that you have to follow in order to create negative sentences using this expression is:

Subject + **would rather** + not + verb (base form) + complement.

*For example: I **would rather not** continue working for this software company.*

After a request, you can also use this expression as an equivalent of I **don't want to**.

For example:

Joseph: I want you to tell me about the company's crisis.

*Andrea: I'd **rather not talk** about that.*

Examples

- *I'd rather not look at the time.*
- *I would rather not be so specific about that.*

Different Options to Perform a Data Validation

Data validation, the process in which you make sure that the system's input is correct, accurate and fully operational, can be made taking into account different options.

In any type of validation, the database that is being validated has to shut down in order to avoid any other users to access the system. Additionally, any type of validation must check and fix the following aspects:

- Orphan pages
- Report of misallocated pages
- Faulty data structures

Look at the following chart to know more about the different options to perform data validations.

Learning Points

Data validation option	Description
Default Validation	This validation option identifies orphan pages and updates them. At the end, this option updates the system and repairs corrupted structures.
Full Validation	This validation option confirms, reports and updates any type of corrupted structures in both page and record levels.
Read-only Validation	This validation type does not make any changes to the database that is being checked. It only reports all the different areas that show inconsistencies or problems.
Ignore Checksum Error	The validation of the data in a page is confirmed by checksums. In fact, ignoring checksum errors enables the validation of corrupted databases; furthermore, the data recovered by this option will no longer be useful.
