Let's Start!

What options do we have?

Learning Outcome:

Make the coding of the system modules and the main program, starting from using the chosen programming language, based on design specifications.

Exchanges information about requirements types and their characteristics.

Can Do Statements:

- I can describe what the business requirements refer to.
- I can talk about the relationship between functional requirements and the business requirements.

Ask your partner:

- Do you consider that software eases chores for companies? Why?
- What are some of the most common problems that companies face in general? List some of them.

Let's Explore!

Times of Crisis in a Company

Instructions: Read the text below.

- Juliana:** I have a question. How bad is the stock problem for the company?
- George:** Well, we really need to find a solution ASAP; otherwise, economic loss will arise and we will be in trouble. Do you have any ideas?
- Juliana:** We can create a software, a system that helps us out with that situation. That is going to be one of the best solutions to the problem we are facing.
- George:** OK. How grueling is doing all of that?
- Juliana:** First, we will have to delimit the business requirements, which are basically the identification of the problem that we want to address with the system that will be developed. Once we analyze the general situation of the company and determine the objective or vision for the system, we are ready to proceed with the next step.
- George:** What is the next step going to be?
- Juliana:** We continue with the development of the functional requirements, which basically describe the processes of the system in terms of input and output. In other words, we designate the behavior of the system in different situations and the way it is going to respond to the company's issues. All in all, they reflect the way the necessity for meeting the business goals is going to be addressed.
- George:** How different are those two requirements you just mentioned?
- Juliana:** They are closer than you think. The business requirements are the starting point of any system and the functional requirements are based on them. Furthermore, behind any system, there is a necessity for meeting the business requirements.
- George:** Perfect, we are calling a software company right away, then.
- Juliana:** Yes, we meet the Systems Corp people tomorrow at 5.

Let's Practice!

Benefits of Well-established Business Requirements

Instructions: Select the best options in the table. There is only one answer per sentence.

	are going to be able to lay out a project charter.	will help reduce project failures in the future.	to be complemented with a systems reference document (SRD).	this company save a lot in the months to come.
The Business Requirements Document (BRD) is going				
If a business process is explained well in the early stage of the life cycle, it

Key Questions to Solve a Crisis

Instructions: Write the words to correctly complete the sentences. Use: grueling, long, bad, difficult, different.

- How _____ is it to identify and communicate it to the software company?
- How _____ can the description of the process to establish the business requirements be?
- How _____ is the stock problem of the company?
- How _____ is it to do all of that?
- How _____ are those two requirements you just mentioned?

Extension Activity

Let's communicate the requirements to solve the problem.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Imagine that you are the manager of a company and you have to deal with a difficult process.
- Look for information about how to reduce the time that staff spends working on that process.
- Write the procedure and describe the steps.
- Write an email to a software company with the functional and business requirements.
- Share with your partners and instructor.

Self-Assessment

Yes

No

- I look for information about actions plans to reduce time in procedures.
- I write and describe procedures.
- I talk about functional and business company requirements.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **stock** (noun): the amount of products available for customers to buy
e.g. How bad is the stock problem of the company?
- **proceed** (verb): to continue with the next action or phase
e.g. Once we analyze the general situation of the company and determine the objective or vision for the system, we are ready to proceed with the next step.
- **arise** (verb): to occur, happen
e.g. Otherwise, economic loss will arise and we will definitely be in trouble.
- **grueling** (adjective): difficult, hard to achieve
e.g. Okay, how grueling is it to do all of that?
- **ASAP** (expression): acronym for "as soon as possible"
e.g. Well, we really need to find a solution ASAP.
- **all in all** (expression): expression used to conclude an idea, equivalent to "to sum up"
e.g. All in all, they reflect the way the necessity for meeting the business goals is going to be addressed.

Learning Points

Questions With How + Adjective?

Using **adjectives** within how questions helps a lot when you want to inquire about specific characteristics of an element or a person.

The inclusion of **adjectives** within the “*how questions*” helps you find out the attributes as well as the characteristics that a person or an object has. By asking these questions, you can get to know someone or something very well.

You can follow different structures in order to create different types of **how + adjective** questions:

How + adjective + is/are + noun?

How different are those two requirements you just mentioned?

How + adjective + can + subject + verb + complement?

How easy can we create software?

How + adjective + do/does + subject + verb?

How often do we address the necessity for meeting the business goals?

Examples

- *How bad is the stock problem of the company?*
- *Okay, how grueling is it to do all of that?*

Business and Functional Requirements

Within a system, there are various and different **requirements** that work together to make that system function.

BUSINESS REQUIREMENTS

The business requirements are the starting point of any system. These requirements are identified by analyzing the problems or flaws of the business which are then expressed as the goals or objectives that the system will intend to meet and achieve. All business requirements must be clear but have to contain enough information in order to ensure an effective impact on the addressed problem once the system is developed.

FUNCTIONAL REQUIREMENTS

Remember that functional requirements describe the different processes of systems represented in terms of input and output. That is the behavior of the system in different situations. Its writing is characterized by the use of verbs that explicitly define the work that the system must perform.
